

SDM

System Design and Management

Graduate School of System Design
and Management, Keio University

MESSAGE

We want to attract talented people who aim to become the next generation of leaders, and as “cross-disciplinary experts,” realize a new society and integrate a diverse group of specialists.

Seiko Shirasaka

Dean
Graduate School of System Design
and Management

Establish feasible objectives with social value through the ability to ask the right questions

In today's society, where diverse values exist side-by-side and different things are all interconnected and interact with each other, the whole can no longer be viewed as static. In fact, technology is evolving faster and faster, the intensity of various changes in the social environment is becoming more pronounced, and unexpected developments are happening one after another. In this kind of

situation, it can be difficult to decide on what to aim for in the first place. If it were merely a matter of setting our objectives by looking at precedents and extrapolating from that alone, the task would be simple. However, technological advances have made it possible to do things that were previously impossible. Furthermore, changes in the social environment have made it necessary to set our aims differently from before. Thus, the next generation of leaders needs the ability to set the appropriate objectives to aim for. In other words, they need the ability to ask

the right questions. However, without a bird's eye view of the whole picture, the objectives we aim for will only be partially optimal. Likewise, setting unfeasible objectives is meaningless if they cannot be achieved. Even if such objectives are feasible, they will not be truly valuable to society from the standpoint of the provider. In other words, the ability to design by combining social value and realization mechanisms together is necessary for setting objectives with social value, taking into consideration the mechanisms for their realization.

Design and implement concepts to realize objectives

In order to realize the ideal society of the future, it is necessary to take a bird's eye view of society, set our eyes on the vision of the future, and define the mechanisms needed to realize it. At this time, it is not possible to think of businesses and services, etc. — that are responsible for providing value — and the technology, systems, and organizations, etc. — that are the means to realize that value — as separate and independent things. We need to manage these in an integrated manner to ensure optimal design. It is precisely through the integration of multiple specialties that we will be able to realize a society that was previously unattainable. And in order to actualize this mechanism in society, it is necessary to build consensus with various stakeholders and to design and implement a path to the vision of the future. In doing so, it may be suitable for some to proceed by trying things they have not experienced before, while for others it may be appropriate to advance in a well-thought-out, steady manner. In other words, designing also involves combining the path to real-world implementation.

Responding to change

In today's world, there are additional factors we have to take into account.

COVID-19, conflicts in various parts of the world, as well as natural disasters. Unforeseen events continue to occur. The era of VUCA, it seems, has arrived in earnest. VUCA is an acronym that stands for Volatility, Uncertainty, Complexity, and Ambiguity. The era of VUCA refers to a time when the future is not an extrapolation of the present and predicting the future is difficult. Furthermore, the world is moving toward Society 5.0, a society which provides new value by linking previously isolated things to a network. By being connected in a network, changes in the external environment, which would not have affected what had previously been isolated, would now have an impact due to the network. In other words, we are now more susceptible to changes in the external environment than ever before. In this era, the ability to ask the right questions that are not an extrapolation of the present is undoubtedly necessary, but it is also important to design mechanisms for realizing objectives that can adapt to changes themselves. In order to respond to change, it is necessary to identify changes in the external environment that affect the mechanism and to modify the design of the mechanism when change occurs. In addition to that, it is also important that the design be easily adaptable to change. In other words, we will capitalize on change by being ready to respond to it.

Education and research leveraging diversity

Since its establishment in 2008, Keio's SDM has been active in education and research to integrate “objective setting,” “mechanism design,” and “implementation management.” To flip the popular saying on its head, it is important to “envisage the forest by looking at the trees.” To this end, we aim to collaborate with a diverse group of people in order to understand matters from multiple perspectives and to utilize and integrate opinions from diverse viewpoints. This is the “cross-disciplinary expertise” that enables us to leverage our diversity. In order to cross multiple academic fields utilizing this cross-disciplinary expertise, SDM provides a unique education consisting of knowledge in systems, design, and management, and actively conducts cross-disciplinary research. People from a broad range of ages come from all over the world to study together with a diverse group of students, researchers, and faculty members, all with different specialties, to discuss how to create a better society. In the process, students may be exposed to opinions that differ from their own previously held notions. Those who enjoy updating their knowledge from such experiences may be a good fit for SDM. We look forward to welcoming all who are interested in learning and researching together with a diverse group of people with the aim of realizing a better society and acquiring this cross-disciplinary expertise.

INTRODUCTION

Learn System Design and Management in English While Being in Japan

—A Gateway to New Perspectives and Distinct Careers

Broaden Your Horizons with World-Class, Cutting-Edge Knowledge

The Graduate School of System Design and Management at Keio University (Keio SDM) pursues problem solving with a “systems” approach by capitalizing on a broad range of perspectives from the natural sciences as well as from the humanities and social sciences. Mid way between downtown Tokyo and Yokohama close to both by train, Keio SDM enables students to learn the world’s leading systems engineering and design thinking in both Japanese and English.

Keio SDM has a diverse student population made up of various backgrounds, age-groups, and nationalities. Not all students have a background in natural sciences and engineering; and many are professionals who are working in Japanese enterprises and government organizations. At Keio SDM students have ample opportunities to broaden their views by studying alongside these individuals as they encounter diverse values and ways of thinking.

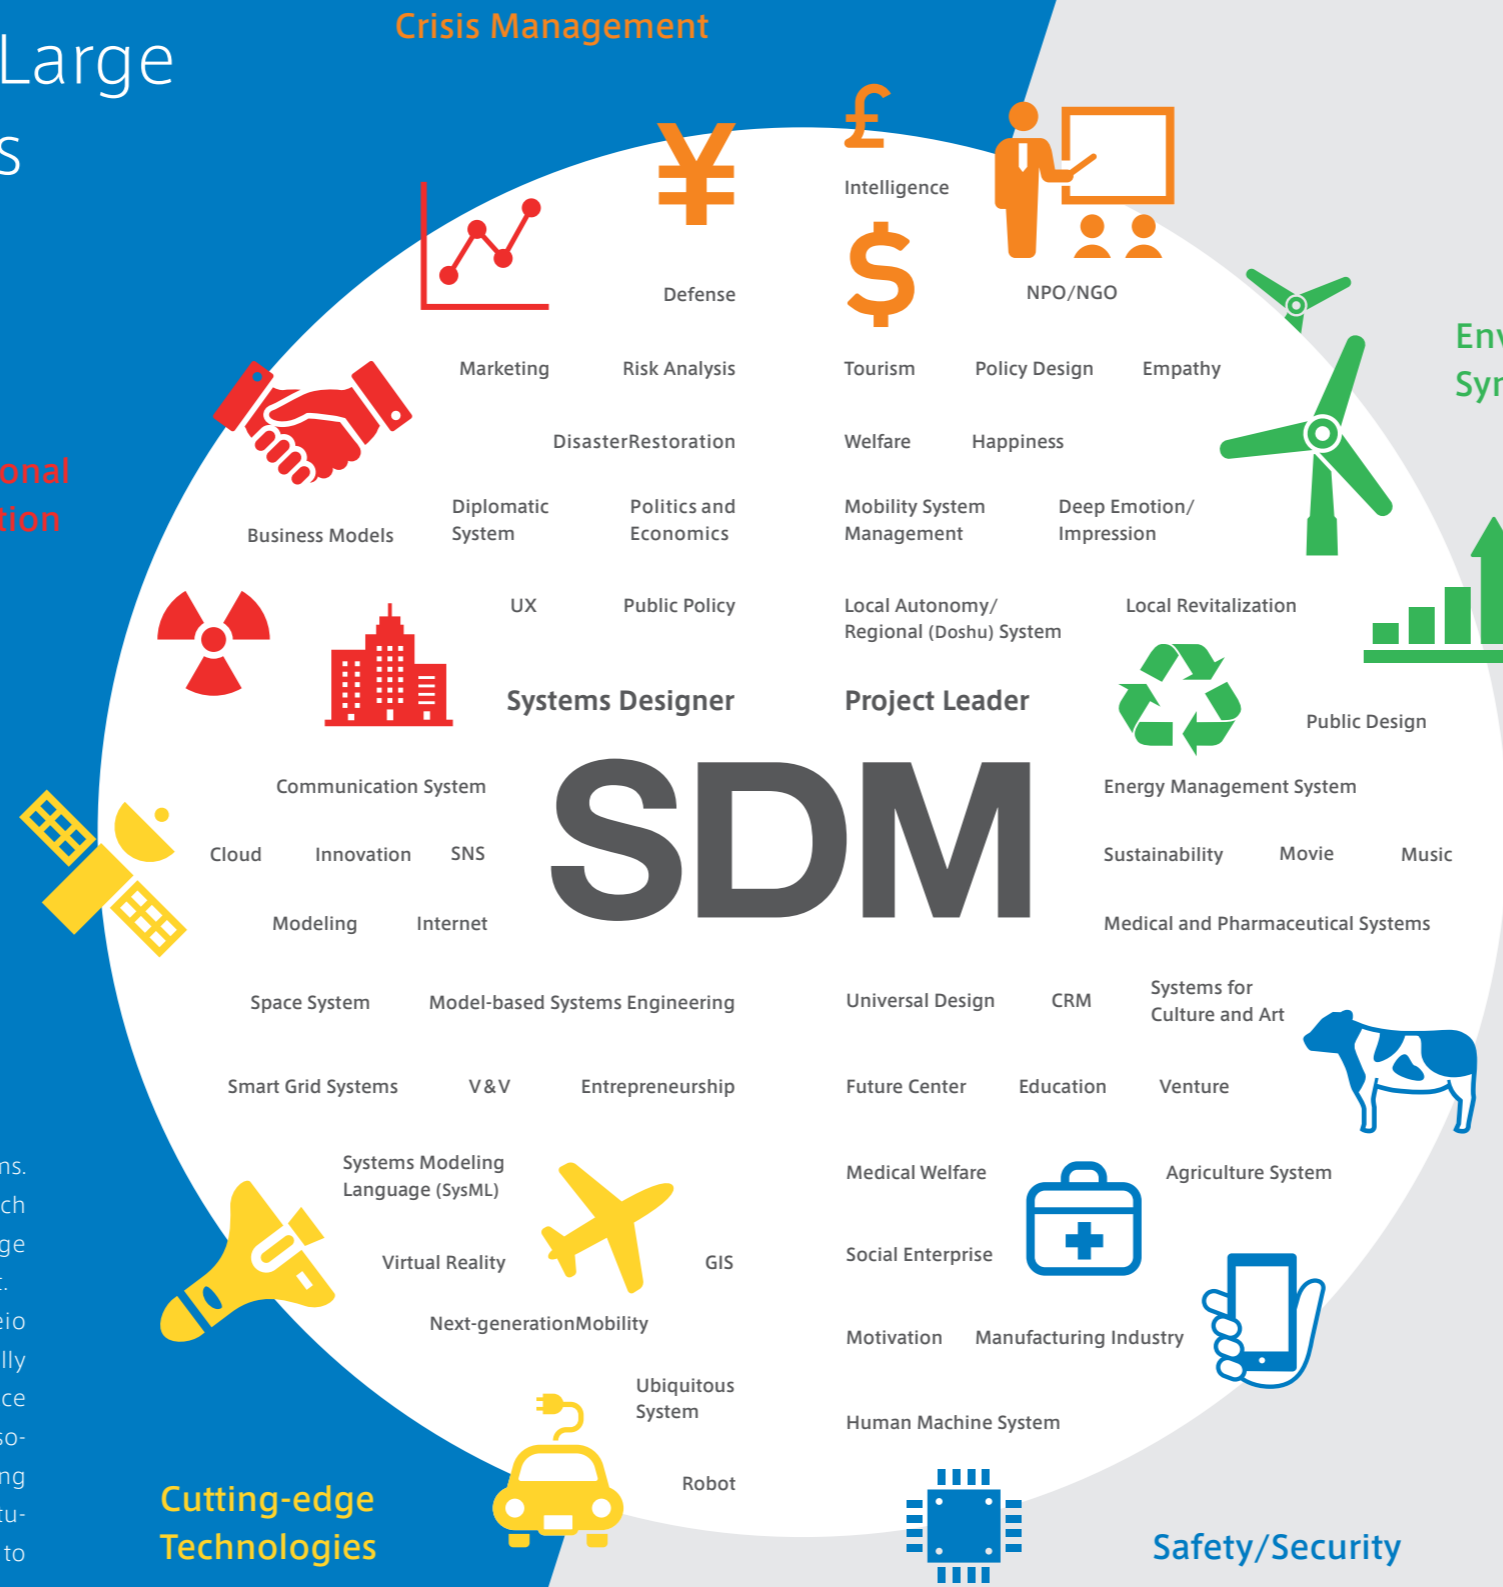

About Keio University

Keio University is among the most prestigious private universities in Japan. It was founded in 1858 by Yukichi Fukuzawa, a leader of modern Japan who is also known as the man portrayed on Japan’s 10,000-yen note. Many Keio alumni are successfully leading in a wide range of fields, including business, technologies, politics, and education. Being a Keio graduate is perceived as prestigious in Japan.

CONCEPT

Nurturing Individuals Capable of Handling Large and Complex Systems beyond Boundaries

Learn Systems Engineering and Design Thinking

Keio SDM deals with a multiplicity of large and complex systems. As we seek solutions, we make sure to consider social needs, such as environmental symbiosis, safety and security, cutting-edge technologies, international cooperation, and crisis management. Two pillars of problem solving methods are employed at Keio SDM. One is systems engineering, which was developed initially for the purpose of designing large systems, including aerospace and military systems. Now it has been extended to include the social sphere. Keio SDM is the only Japanese university participating in the Council of Engineering Systems Universities (CESUN). Students can learn all about systems engineering from the basics to the cutting-edge at Keio SDM.

The second pillar is known as design thinking. It is a development method which uses techniques, such as fieldwork, brainstorming, and workshops, to generate ideas. Its aim is innovation through drawing out the creativity of participants.

With systems engineering alone, it is difficult to accommodate different perspectives of multiple stakeholders for the purpose of innovation. Design thinking, on the other hand, tends to be weak at taking a systematic approach to the shaping of ideas. Keio SDM has successfully created a development method which combines the two in a complimentary way. At Keio SDM students learn how to create an optimal fusion of systems engineering and design thinking. This equips them with the capability of tackling large and complex systems.

Developing a Wealth of Skills

Keio SDM nurtures future systems designers and project managers who are capable of designing and managing multiple systems. One needs to have a diverse set of skills in order to coordinate with multiple stakeholders for the purpose of creating systems. Keio SDM offers a range of programs to produce individuals with a wide spectrum of skills and abilities.

POLICY

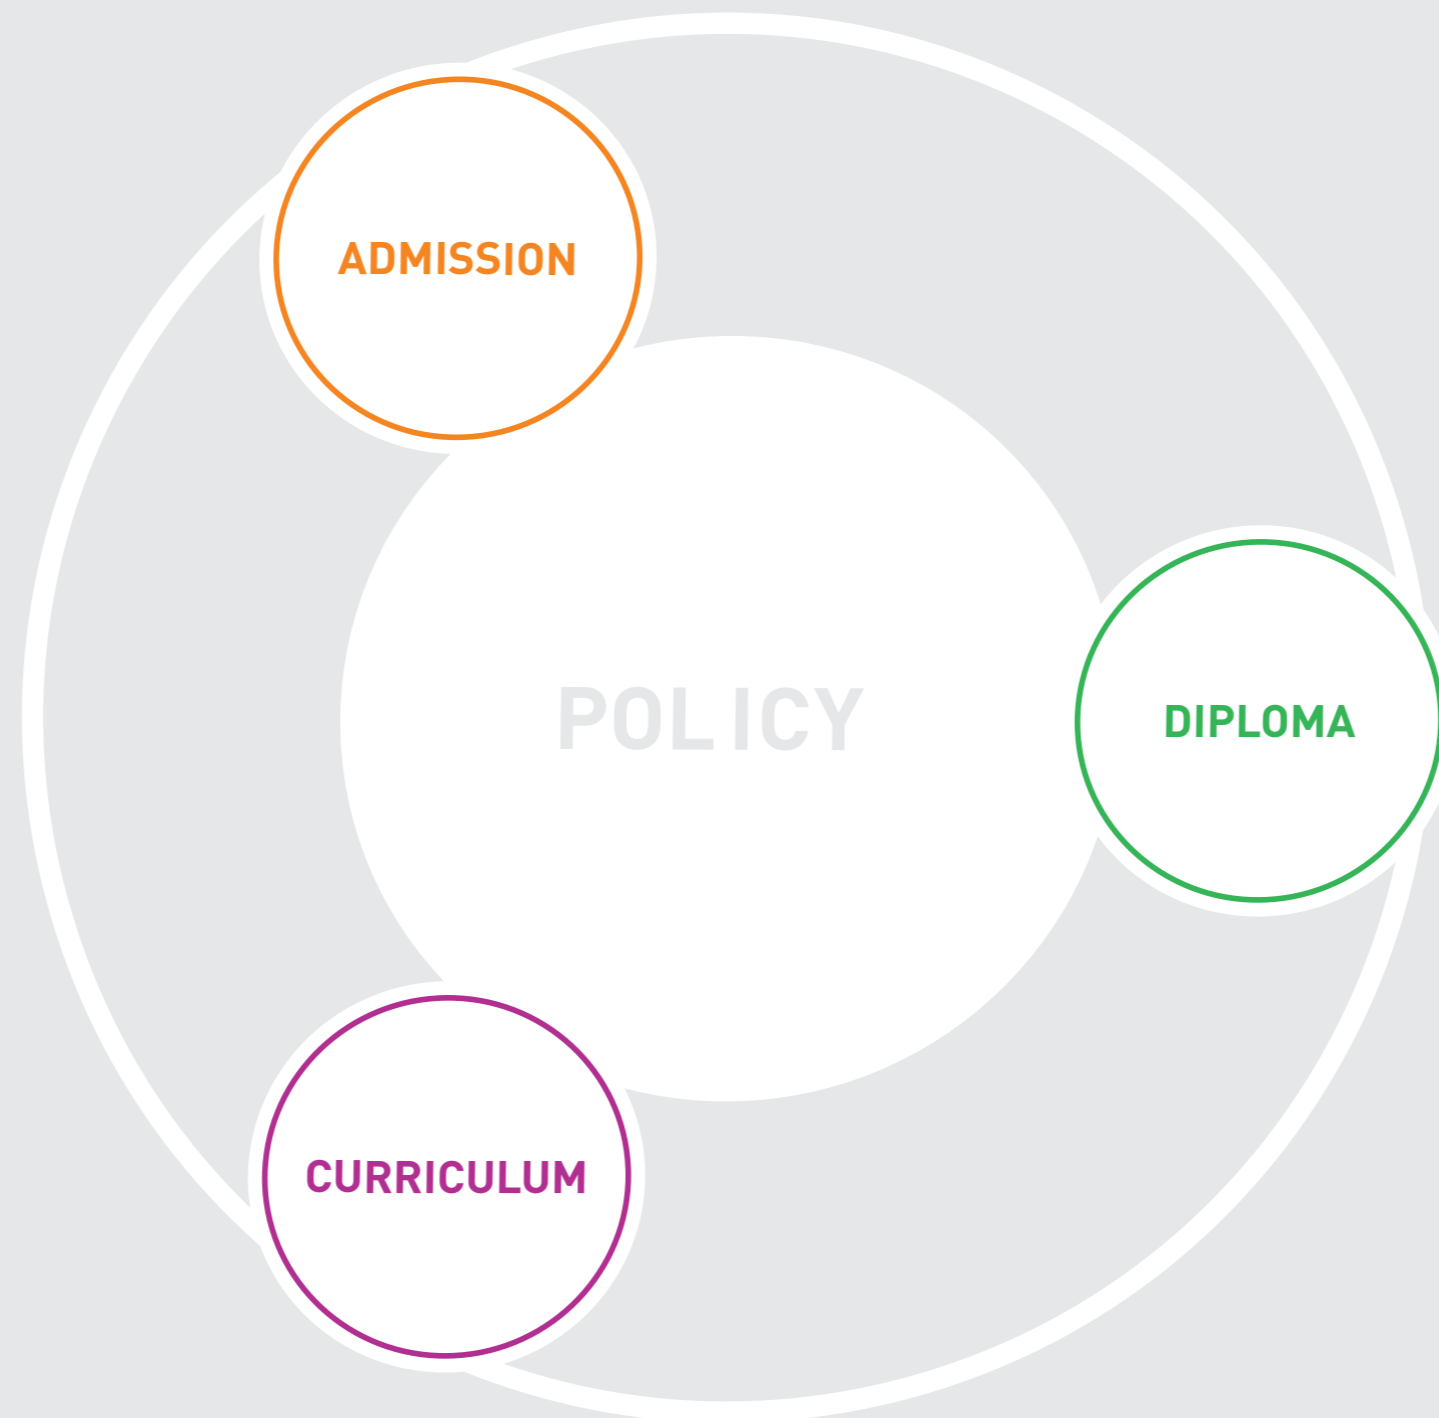

Admissions Policy

For the master's programs, we admit: students aspiring to conduct research and put into practice the design and engineering of innovative technological and social systems that will contribute to resolving many large-scale and complex issues of the modern day; students aspiring to conduct research and implementing leadership and management skills required to propose solutions to issues in today's diverse social systems as well as guiding these projects to success; and students with the sufficient aptitude, skill-set, and desire to learn alongside a diversity of peers and apply their learning to society. In order to foster professionals befitting these degrees, we admit students from many walks of life, including those continuing to graduate school directly after completing a bachelor's degree and those with hands-on experience (early career/seasoned professionals) at organizations in the public, private, and other sectors. In order to accept a wide range of such candidates, admissions will be conducted via document screenings, written examinations, and interview examinations.

For the doctoral programs, we admit: students aspiring to conduct advanced academic research and put into practice the design and engineering of innovative technological and social systems that will contribute to resolving many large-scale and complex issues of the modern day; students aspiring to conduct advanced academic research and implementing leadership and management skills required to propose solutions to issues in today's diverse social systems as well as guiding these projects to success; and students with the sufficient aptitude, skillset, and desire to learn alongside a diversity of peers and apply their learning to society. In order to foster professionals befitting these degrees, we admit students from many walks of life, including those with hands-on experience (early career/seasoned professionals) at organizations in the public, private, and other sectors. In order to accept a wide range of such candidates, admissions will be conducted through document screenings and interviews focusing on the applicant's doctoral research plan.

Curriculum Policy

The master's program systematically develops its educational curriculum, which consists of core subject, project subject, special research subjects, recommended basic subjects, and recommended advanced subjects.

For the master's program in System Engineering, students primarily engage in research over a two-year period (standard) in fields related to the design of technological systems, compiling their findings as a master's thesis. For the master's program in System Design and Management, students primarily engage in research over a two-year period (standard) in fields related to design in social systems, which they then compile as a master's thesis.

For the doctoral programs, it is possible for students to take subjects taught as part of the master's programs in order to study required subjects (especially core subject, etc.). For the doctoral program in Systems Engineering, students primarily engage in research over a three-year period (standard) in fields related to the design of technological systems, on which they write a doctoral dissertation while being evaluated by external specialists through presenting their findings in Japan and abroad. For the doctoral program in System Design and Management, students primarily engage in research over a three-year period (standard) in fields related to design in social systems, on which they write a doctoral dissertation while being evaluated by external specialists through presenting their findings in Japan and internationally.

Diploma Policy

Both the master's and doctoral programs have degrees in "System Engineering" and "System Design and Management."

Under the Master of System Engineering program, students first take core subject and project subject, followed by survey subjects to broaden their perspective. They are then expected to demonstrate their understanding of foundational modes of thought, knowledge, and skills in the field by compiling their research related to the design of technological systems into a master's thesis. Under the Master of System Design and Management Studies, students first take core subject and project subject, followed by survey subjects to broaden their perspective. They are then expected to demonstrate their understanding of foundational modes of thought, knowledge, and skills in the field of System Design and Management by compiling their research into a master's thesis.

The Doctor of System Engineering aims for students to acquire professional modes of thought, knowledge, and skills in system engineering by either authoring academic papers in fields primarily related to the design of technological systems and having these papers evaluated by specialists, or designing their own system that is then evaluated by specialists, compiling their findings into a doctoral dissertation. The Doctor of System Design and Management aims for students to obtain specialized modes of thought, knowledge, and skills in system engineering by either authoring academic papers in fields primarily related to design of social systems and having these papers evaluated by specialists, or designing their own system that is then evaluated by specialists, compiling their findings into a doctoral dissertation.

Knowledge and Experience —Both Essential for Developing Capability

Our curriculum aims to build collective strengths by combining knowledge with experience. Students first gain knowledge from lectures on systems engineering, design thinking, management capability, and specialized subjects. They are then invited to work on real-life projects and explore practical solutions. With our approach of combining knowledge with experience, students grow into integrated professionals who are capable of building and managing systems with precision.

Classes Offered in the Master's Course

Major Subjects in Systems and Socio-Tech Engineering

Major Subjects in Political, Economic and Business Systems

Major Subjects in Safe, Reliable, Human, Symbiotic and Innovation Systems

Master's Course Schedule (Fall Admission)

	1st year		2nd year	
	Fall semester	Spring semester	Fall semester	Spring semester
Required subjects	Intro to SDM	SA&I SV&V D-Pro	PM	
Major subjects	RI 16 credits or more		LI 32 credits or more	
Master's research	RI Theme Presentation	Interim Presentation 1	Interim Presentation 2	Examination of master's thesis
	LI	Theme Presentation		

Students in the master course learn the basics of systems engineering through the mandatory core subjects. Additionally they take specialized subjects covering specific fields and recommended advanced subjects covering multidisciplinary topics according to their interests. By creatively combining these subjects, students can broaden their knowledge towards a wide spectrum of subjects. Classes are offered in Japanese and/or English. It is possible to complete the master course by selecting only classes in English. Core subjects are offered both in Japanese and English; Japanese classes normally begin in April while English classes begin in September. It takes practical experience to effectively design and manage real-world systems. Students in the first year master course learn design thinking and work on real-life issues in the Design Project. In parallel, they proceed to practical research in special research subjects; and the results are compiled in their theses. At Keio SDM we set high standards for masters research. The doctoral program offers more specialized research opportunities. Doctoral students can take masters classes according to their interests. Quite a few of those theses end up presenting at international conferences.

CURRICULUM

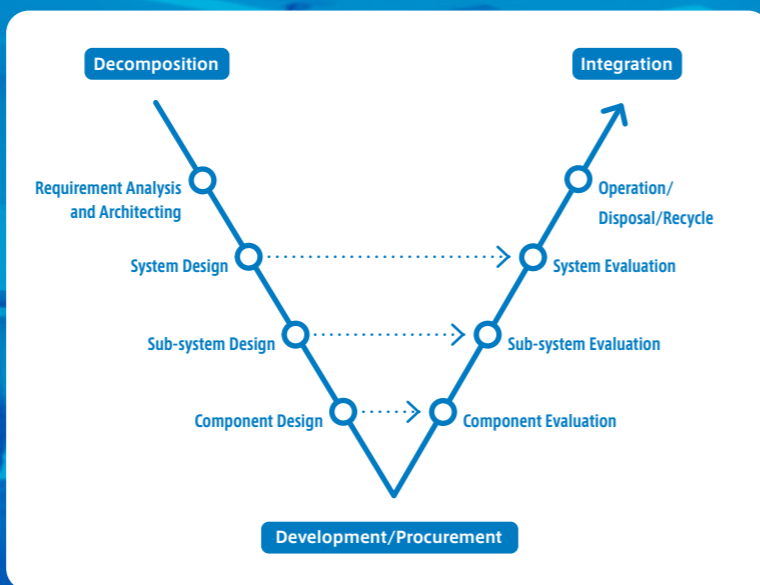

Students in the master course first learn the basics of systems engineering and other fundamental skills necessary to deal with systems. Building on this, they acquire knowledge about systems of various fields in specialized subjects. Additionally they learn design thinking in the Design Project.

Linking Knowledge

Students first learn the V-model, an important concept of systems engineering. The V-model structures systems by decomposing requirements and integrating parts and their validation. This model can be used as a broad framework to capture how the entire process relates to each specific part. One can apply the model to system development of various fields, including those which are scientific and technical, social, and human.

Building on basic knowledge of the V-model, students take a variety of specialized subjects. Students can learn in a systematic and structured manner by using the model as a common framework, linking a broad spectrum of knowledge.

At Keio SDM we use the V-model to decompose, integrate, design, and evaluate by precisely defining the diverse requirements of the stakeholders, by sharing information, and by creating complete pictures of systems.

Intensive Lectures in English

Keio SDM's strength is not only that the curriculum can be completed solely in English. A series of intensive lectures are offered in English by the world's leading professionals and researchers from different fields.

This international learning environment as such makes Keio SDM an ideal environment for the growth of globally-minded professionals who are capable of accommodating different cultural perspectives.

List of Past Intensive Lectures (with titles as they were at the time)

"System Architecture and Integration"

Prof. Rashmi Jain (National University of Singapore)

"Supply Chain Management and Business Games"

Prof. Paul Schoensleben (ETH, Switzerland)

"Collective Dynamics of Firms"

Prof. Dr. Frank Schweitzer (ETH, Switzerland)

"Technical Entrepreneurship & Management"

Prof. Duncan Moore (University of Rochester, US)

"Risk Management"

Prof. Gilles Motet (INSA, France)

"Space Applications"

Prof. Dipl.-Ing. Heinz Stoewer (President Space Associates GmbH, Germany)

"Stanford Center for Design Research Workshops"

Dr. Larry Leifer (Stanford University, US)

"Object-Process Methodology (OPM) with Application to Systems Engineering"

Prof. Dov Dori (MIT, US)

From Basics to Application —the Design Project

The Design Project aims to propose innovative systems by using the system design and management method developed collectively by Keio University, MIT, Stanford University, Delft University of Technology, and the University of Adelaide. In the Design Project students put systems engineering into practice while learning about design thinking.

In the Design Project students begin with the basics and then move on to practical learning. After taking a number of lectures taught by guest lecturers from partner universities overseas, students work in groups to work on themes proposed by various organizations. The proposers often include leading Japanese companies; and international students have a great opportunity to get acquainted with the unique characteristics, strengths, and cultures of Japanese enterprises.

Examples of Solutions Derived by Students with the Theme "Safety and Security"

"Building New Brand Image of Safety and Security Using Positive Cycle Business Model"

Proposer company: Adidas

"Portable Multi Energy Backpack System for Refrigerating Vaccines"

Proposer company: Kokusai Kogyo group Infrastructure Innovation Institute, Inc.

"Safe and Secure Solar Power Generation in Japan - Dual Mode Solar Panel System: Proof of Concept"

Proposer company: Delft University of Technology

"Safety Premium Point System"

Proposer company: Suzuki Motor Corporation

"Design of Bicycle Simulator to Reduce the Risks of Traffic Accidents"

Proposer company: Toshiba System Technology

CURRICULUM

Keio SDM emphasize the importance of hands-on experience.

Students are encouraged not only to gain textbook knowledge about systems but also to experience real-life situations, to clearly articulate issues, and to come up with innovative, feasible solutions.

It is when one is actually seeking solutions to complex systems that most discoveries and realizations come.

We believe in experiential learning, that one learns most by doing.

Learning by Doing —Experiential Learning

Insight into the “On-Site” Realities of Japan

Keio SDM has strong ties with private companies. This means our students have the privilege to observe “on-site” scenes of Japanese companies through various opportunities.

For example, we arrange visits to distinctive factories as a part of the curriculum. In the Design Project students have the opportunity to visit the workplaces of proposing companies and work collaboratively with their staff members. Furthermore, Keio SDM has a great number of on-going joint research projects with private

companies, facilitating students to have close and frequent communication with the companies. Many faculty members of Keio SDM come from private firms; and some internship opportunities can be facilitated for our students by virtue of their strong connections with the companies.

Keio SDM offers its students valuable opportunities to engage with Japanese companies, providing opportunities to gain insight into the secret of their strength and the “on-site” realities.

Laboratory Participation and Thesis Writing The Special Research Subject

The core of the master’s program is the special research subjects “System Design and Management Research” and “Project Design and Management Research”.

Students will engage in research for two years (standard) under the guidance of their academic advisor while participating in a laboratory. Research does not stop at mere analysis. It is required to design solutions that will change the world for the better as a system, implement them in society, and evaluate them.

After compiling the results of the research as a master’s thesis, the degree will be certified after a presentation and question and answer session at the master’s thesis examination. It is expected to be the culmination of the knowledge and experience acquired at SDM.

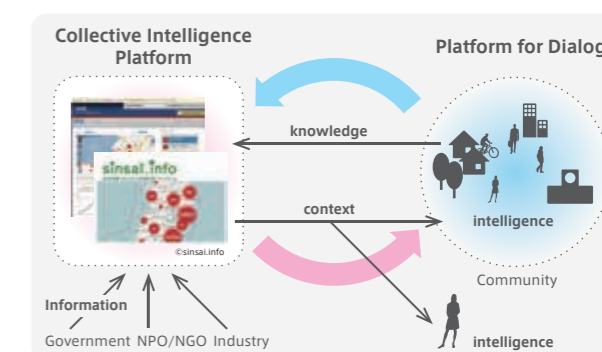

Study Case

Portfolio Optimization for Environmentally-Conscious Automobiles

Many environmentally-conscious automobiles are being developed and sold, such as the ones based on electric, fuel cell, natural gas, and gasoline-electric hybrid technologies. We use the system approach (simulation and system optimization) to study portfolio maximization—analyzing which type of automobile should be brought to the mainstream given the various constraints, such as those related to environment, energy, resources, aging population, and development in emerging nations.

Resilient Community Design: Knowledge Creation for Safety and Security

Communication Design Process: Knowledge Creation for Safety and Security

Organizational Management Establishing Culture and Safety Consciousness within Companies

We conduct research into ways in which companies can develop a positive culture and work atmosphere in which staff members feel motivated and rewarded. Our research also asks questions concerning how to establish excellent companies with a high level of safety

consciousness, risk management, and profitability. We study companies’ strategies that enable effective management—creative ways to motivate employees while nurturing teamwork and good communication within an organization.

Disaster-Prevention Message Delivery Service

At Keio SDM we use smart systems, such as IT systems and space systems, in order to create socio-technical services and their processes. In search for resilient community design process, we do research on a disaster-prevention message delivery service using a satellite and GPS receivers. We study a distributed autonomous cooperative community design process that is resilient and based on the fusion of two platforms: dialogue and IT.

Diverse Careers and Fields of Research Create New Challenges

The backgrounds of Keio SDM's faculty vary from industrial experience to active careers in the international arena. Their career paths and research areas are so diverse that new research ideas and activities are being generated every day at Keio SDM through borderless intellectual interactions.

SHIRASAKA, Seiko Dean, Professor

Engaged in space development at Mitsubishi Electric Corporation for 15 years, where he has been in his current position since 2010. In addition to research, he also conducts various activities necessary for the social implementation of research results.

Creating the future through cross-disciplinary expertise that leverages diversity

Research topics

We will conduct research that contributes to the creation of the future for more people through the construction of methodologies that integrate academic and field knowledge. In particular, we will focus on research related to the mechanisms necessary to convert the state-of-the-art technology into value for society.

Messages

We look forward to working with you to create the future through methodologies that leverage diversity.

HOSODA, Chihiro Professor

PhD in Medicine (Tokyo Medical and Dental University). Associate Professor at Tohoku University (Institute of Development, Aging and Cancer; Graduate School of Information Sciences). Professor at Keio University Graduate School of System Design and Management (SDM).

Designing human connection and learning through neuroscience

Research topics

In our lab, we apply AI to large-scale human datasets that include brain measures, working with students, industry partners, and local governments to co-design environments that strengthen learning and human connection and support well-being. We rigorously assess impact and translate evidence into real-world practice.

Messages

Turn ideas into solutions that work in the real world—grounded in evidence and refined in the field. Let's design the future together at SDM.

INOKUMA, Hiroko Professor

EY Ernst & Young ShinNihon LLC, Associate Professor at the Graduate School of Economics and Management (Accounting School), Tohoku University, and Professor at the School of Liberal Arts and Sciences, Musashi University (with the alignment of the Parallel Degree Programme Education Centre University of London, LSE). Certified Public Accountant (Japan).

Redesigning economic and social systems to create a sustainable society

Research topics

- Redefining and restructuring capitalism, reviewing the workings of the economic system and its social implementation.
- Institutional design to accommodate cross-border movements of funds and business activities.
- IT governance and third-party assurance, audit and assurance for autonomous decentralized platforms.

Messages

Build your own research area in an environment of diverse students and highly individualistic lecturers.

NISHIMURA, Hidekazu Professor

Moved from research and education in dynamic systems control to the world of model-based systems engineering. Design systems of businesses, services and products

Build a future with everyone thinking of authentic

Research topics

What should be the relationship between society and technology where people carry out various activities? Think through the interaction among people, society and technology by using UAF/ SysML in order to lead to solutions to problems in the natural environment, management, finance, logistics, transport environment, product development, etc.

Messages

We live in an era of great change. Why not take a step forward using the model to create a better future?

SUIMON, Yoshiyuki Associate Professor

After serving as a Senior Economist and Head of the Data Science Department at Nomura Securities, I joined Keio SDM. MBA, University of Michigan; Ph.D. in Engineering, University of Tokyo.

Unraveling socioeconomic systems through mathematical techniques and data science

Research topics

Focuses on mathematical and data-driven analyses of human and corporate behavior in relation to economic activities and social phenomena. In addition to quantitative approaches, also emphasizes qualitative methods such as literature reviews, discussions, and interviews.

Messages

Let's explore and uncover the forefront of dynamic systems in society, economy, and finance together!

TAMAKI, Emi Professor

Specializing in HCI and BodySharing, she works across academia and industry. Through shared experiences, she advances research, social implementation, and cultural innovation.

Redesigning society and technology through experience

Research topics

She explores ways to treat human bodily sensations and movements as data and integrate them into AI systems. With students, she develops experiential technologies and applies them across diverse social contexts.

Messages

Let's explore beyond boundaries and shape ideas into reality through practice, together.

IOKI, Makoto Associate Professor

Worked in satellite design and space business strategy planning at Mitsubishi Electric Corporation. Later, at the Japan Space Systems, he was in charge of international cooperation and the promotion of the overseas expansion of the space industry.

Design the future together with a bird's eye view of the world

Research topics

We will guide you to develop the ability to see things from a bird's eye view and from multiple perspectives, and to acquire skills through practice. We will emphasize the importance of "learning how to learn," and foster the ability to quickly absorb knowledge in unknown fields and apply it to solving problems. Research themes will be set individually, with an emphasis on each student's awareness of issues.

Messages

Together, we will discover the as-yet-undefined challenges of the real world and do our best to support your growth towards solving them!

KOHTAKE, Naohiko Professor

After contributing to research and development of H-IIA rocket at JAXA and collaborating internationally with NASA and European Space Agency, he has held his current position since 2009. He has served as Principal of Keio Yokohama Elementary School and is currently President of Space Service Innovation Laboratory Inc. He is PMP certified by PMI and holds a Ph.D. in Media and Governance.

Breaking boundaries across domains, regions, and generations to make a global impact through education, research, and business

Research topics

Research is promoted on system design and management studies that utilize diverse data and AI to explore future possibilities and risks in a wide range of fields, including space development, education, sports, livestock production, agriculture, urban development, and disaster prevention, both in Japan and internationally

Messages

Let's tackle global challenges from both a broad and precise perspective, embracing a 'Fail Fast' approach with a mindset that balances learning and teaching, while valuing hands-on experience in the field.

NIITSUMA, Masahiro Associate Professor

He holds an M.S. in Open and Environmental Sciences from the Graduate School of Science and Technology, Keio University, and a Ph.D. from Queen's University Belfast. After serving as an assistant professor at the Faculty of Information Science and Technology, Ritsumeikan University, from 2013, he became a full-time lecturer at Keio SDM in 2021 and has been an associate professor since 2023.

Exploring true "living" through a holistic approach distinct from conventional methods

Research topics

His main interest lies in artificial intelligence, particularly its application to analyzing J.S. Bach's handwriting and the evolution of his works. To address perspectives often overlooked by conventional natural science, he is working to understand embodied knowledge rooted in traditional Asian wisdom, such as Buddhism, and to model it using a systems approach. His aim is to incorporate the results of these efforts into definitions of social concepts and, ultimately, to realize a truly harmonized world.

Messages

In an era where technology is displacing our jobs, why not revisit and explore the meaning of our existence?

TOMA, Tetsuya Professor

Master in Applied Chemistry, Graduate School of Science and Technology, Keio University, Japan; worked for 20 years as a Product Development Specialist at 3M companies in both Japan and the US before joining Keio University. PhD in SDM, PMP; visiting researcher at MIT 2019-20.

Challenging of creating a bright future in cross-disciplinary teams

Research topics

Research on social issues such as information and communication, healthcare, education, regional revitalization, organization, communication and project management, using an interdisciplinary approach that links technology and people. Guide students to make them feel that they want to do more research upon completion of their thesis.

Messages

Enjoy valuable research that brings together knowledge from multiple disciplines to solve problems and aims at social significance and innovation.

YAKOH, Takahiro Professor

Prior to his current position, he worked for 25 years at the Faculty of Science and Technology, Keio University. His expertise includes code theory, image processing, data analysis, artificial intelligence, and digital transformation. Ph.D. in Engineering

The challenge of developing intelligent systems to solve social problems

Research topics

AI-based 3D model generation, knowledge sharing and transfer using generative AI, healthcare using generative AI, adverse event detection using prescription data analysis, data augmentation methods for structured information, DX of logistics, AI transformation of education

Messages

Learn about rapidly evolving digital technologies, how to identify their trustworthiness, and develop the skills to use them effectively.

YAMAGATA, Yoshiki Professor

Graduated from the University of Tokyo with a BA in Liberal Arts and spent 30 years working on climate change research at the National Institute for Environmental Studies, where she also served as IPCC representative author and other positions. Currently teaches and researches on the design of sustainable urban systems.

Co-creation of a future society in which the environment and health are in a virtuous circle

Research topics

Climate change mitigation and adaptation in cities; analysis and visualization of urban information to analyse big data; development of digital twin urban and regional sustainability simulation methods.

Messages

Co-create the design of future urban systems and contribute to building a sustainable society.

VOICE FROM ALUMNI

I like the cross-cutting approach of Keio SDM

I chose Keio SDM because I was interested in the automobile industry and looking for a Japanese graduate school which offers a relevant course in English.

I am satisfied with the number of classes that Keio SDM offers in English. I also like its concept of learning more than engineering. At Keio SDM we cover a wide range of subjects, such as design, business, economics, and policies. The curriculum is designed in such a way that we get our hands on real projects after going through theories. I find this to be highly effective. I feel encouraged to

be creative as students here are eager to work together and take pleasure in meeting new cultures and individuals of different backgrounds.

I spend weekends doing a variety of things, including going to parties, attending concerts, and visiting design exhibitions. Something exciting is always happening in Tokyo; it's never a bore. I feel that Tokyo has countless possibilities to offer.

Kamila Romejko

Completed Doctoral Degree in September 2017
Completed Master's Degree in September 2014

Global Insights, Local Impact: Leveraging SDM Knowledge in a Cross-Cultural Workplace

Upon completing the SDM program, I realized that true innovation and impactful problem-solving are born from the convergence of diverse perspectives. Having spent significant time in China, Japan, and Malaysia, I initially believed I had a broad cultural understanding. However, at SDM, I encountered professionals and experts from various industries, age groups, and cultural backgrounds who pushed me to challenge my assumptions. Their unique ways of thinking amplified my own experiences and showed me the importance of cultivating a subjective, yet empathetic viewpoint—especially when designing solutions for complex, real-world problems. SDM approach encouraged me to not only

consider logical structures (the “system”) but also the human experiences and emotional nuances (the “design” aspect) that often spark genuine innovation.

I have been a Talent Sourcing Specialist at IBM (global team) for only four months. From my very first month, I actively participated in a global design workshop with stakeholders from the US, Singapore, and China. The topic was to be tackled cross-cultural sourcing challenges in my team (Japan team)—unclear recruiter–manager communication, and a misaligned Japan strategy. By mapping stakeholders’ pains, we co-created solutions, such as real-time market insights and tailored collaboration

Michelle Eng

Completed Master's Degree in September 2024

protocols for Japan’s unique labor environment. SDM’s methodologies—design thinking, systems perspective, and collaboration—proved invaluable in aligning global management with on-the-ground realities and boosting our competitiveness in the Japanese market.

Hamad El Gibreen

Completed Master's Degree in September 2017

I stumbled upon Keio SDM a year after completing my undergraduate degree. It offered the potential for unique, interconnected, holistic knowledge and real-world application. To get the most out of the program, I decided to gain more

SDM has radically changed the way my brain works to deal with daily challenges.

work experience in the transportation sector before enrolling.

To my amazement, SDM has not only exposed me to a wide range of knowledge (from political economy to entrepreneurship), but it has also fundamentally changed who I am as a person and how my brain works and processes daily challenges.

To embrace the SDM experience is to reset your brain to its original systemic ability to see the whole as well as the part. You will learn the art of moving through multiple levels of abstraction to see how everything is integrated from multiple perspectives. Best of all, SDM will bring back the childlike nature of those who embrace it, unleashing the human inner

playfulness as an imperative action to enable innovation.

Nearly a decade later, I still hold the results of SDM close to my heart and use them every day. From developing strategy in my organization to addressing technical challenges and safety incidents through systems and design knowledge, the insights I gained from SDM professors, colleagues, and friends, as well as my experience in Japan, have proven invaluable in better understanding myself and others’ perspectives.

Truly, investing in Keio SDM is investing in transforming yourself.

Naomi Simumba

Completed Doctoral Degree in March 2022
Completed Master's Degree in September 2018

International Opportunities Just A Click Away

I did my bachelor’s degree in electrical engineering in my home country of Zambia and had heard about the System Design and Management program at MIT when I stumbled upon Keio SDM in an online search. After successfully applying for a Japanese government scholarship, I joined the master’s program in September 2016. I am now a Ph.D. student, and both programs have exceeded all of my initial expectations.

At Keio SDM, you put problem-solving skills into practice through research, gaining plenty of hands-on experience along the way. During my mas-

ter’s program, I had to balance coursework with my research in Cambodia, where I had a real difference in people’s lives. In the Ph.D. program, on the other hand, I have been identifying unique, unprecedented issues that add value to my field of study. And you can apply to Keio SDM with just the click of a button, no matter where you are in the world. If you’re looking for a life-changing experience, I would say there’s no better place than Keio SDM.

FAQ

Frequently Asked Questions

Q1

What kind of scholarships do you have?

There are a number of scholarships for international students, such as Keio “Design the Future” Award for International Students, as well as different scholarships provided by Keio University, Japan Student Services Organization (JASSO), the government of Japan, and other private foundations. All scholarships aim to enable personally and academically outstanding students in need of financial assistance to continue and focus on their studies and research. Most of the scholarships are targeted towards regular students who are on a student visa and studying at their own expense. Please follow the link below for more information regarding scholarships.

Q2

I do not speak Japanese. Can I still be admitted?

The answer is yes, you can still be admitted to Keio SDM even if you do not speak Japanese. We give entrance examinations in English; and students can choose to complete the course using only English. Having recognized the importance of internationally competent staff from the very beginning of its establishment, Keio SDM has administrative staff members who can assist in multiple languages. As for the faculty, those who have been educated and/or trained overseas and have sufficient language abilities are assigned to assist international students.

If you wish, you can learn basic Japanese by taking Japanese classes. The university has well-established Japanese language education which began in the 1950s.

Q3

I cannot come to Japan for the entrance examination.

You can send your application documents by post regardless of whether you reside inside or outside of Japan. You will be called for an interview if you pass the document review. There is no need to come to Japan for an interview as we can conduct it online, using technologies such as zoom, for those who reside outside of Japan. Please refer to our examination literature for more details.

Q4

Can I get help with accommodations?

Keio University has a number of reasonable accommodations for international students. In the vicinity of Hiyoshi Campus, where Keio SDM is located, there are a number of dormitories with easy access to the campus, such as Shimoda Student Village (designed for international students), dormitories for both Japanese and international students. Each dormitory has Japanese residence assistants who facilitate interactions among students and provide daily life support especially for international students.

For international students who wish to rent apartments privately, the university can introduce real-estate agents who can provide services in English. We also have an insurance scheme whereby the university acts as the guarantor.

Q5

What kind of future careers do international students have after Keio SDM?

International students take on a variety of career paths after Keio SDM; some join Japanese companies; some return to their countries to work; and others go on to further education.

Almost half of our Japanese students are company employees, and many of the faculty members come from private firms. As a student you also have ample opportunities to connect with companies through the Design Project and other research work. Many international students have made use of these opportunities to get jobs with Japanese companies. Because Keio SDM graduates are internationally-minded and capable of navigating in different cultures, many also find opportunities within international enterprises.

Many alumni are now playing active roles in various fields and industries. The network you will encounter by studying at Keio SDM will be an asset to your future business and career. We have seen new business started up through participation in our network.

Q6

Do you have affiliated schools? What kind of arrangements do you have with these schools?

Keio SDM has collaborated with Massachusetts Institute of Technology (U.S.), Stanford University (U.S.), Delft University of Technology (the Netherlands), and the University of Adelaide (Australia) to develop an educational method for design projects. At Keio SDM we are putting this into practice in one of the subjects, the “Design Project”, thereby continuing to improve upon the educational method. We also have international exchange programs. The partner schools include: MIT, Stanford, Delft University of Technology, the University of Adelaide, National Institute of Applied Sciences Toulouse (France), the Politecnico di Milano (Italy), and Purdue University (U.S.). Every year a number of students come from these schools to study at Keio SDM.
